## Benefit from smart central printing

### Solution for the central print room

dots Cockpit 4 JTX makes it easy – and secure – to send jobs to the print center. So easy and secure, in fact, that moving print volume to central facilities is bound to be a success.

### Print job submission via intranet

If you want a centralized intranet print solution, dots Cockpit 4 JTX is exactly the right choice. Even if your enterprise works with multiple IT platforms, you can easily integrate them all using the many different dots printing clients – such as the dots JT Printer, which generates the unique dots Job&Order Ticket or the optional dots JT Printer for Terminal Server. Every author connected to dots Cockpit 4 JTX works with the same solution, on the same print server. Your benefit: network maintenance and development is simpler than ever before.

### Web2Print via dots iSWT 4

Combine dots Cockpit JTX 4 with the dots iSWT 4 interactive printing portal and experience web-based job submission at its best. This combination is ideal for companies who want to avoid installing software on user workstations or wish to profit from greater transparency of order placement via the web interface.

### Professional printing functions

dots Cockpit 4 JTX is a superior printing software, with a proven track record for dealing with professional-grade print challenges without compromising on quality. It offers a wide range of professional printing functions such as imposition and extended media programming, as well as easier workflow administration using job ticket data.

### Workflow automation tools

dots Cockpit 4 JTX features a rich set of tools for automating your printing processes – such as the ECMA-based dots Script to match the software to your enterprise workflows. Or dots JT Hot Folder to automate job processing with Postscript and PDF files using predefined folders. Factor in the power of Job&Order-Ticket technology, and you can plan and steer virtually every detail of your print workflows.

### New: Color Split option

The dots Color Split option helps substantially reduce print costs by ensuring that color printers only print the job pages which actually contain color – all the other pages are routed to black & white systems. Following printing, dots Colour Split automatically re-assembles the pages in the correct sequence.

### New: customizable Job&Order Ticket

The new customizable Job&Order Ticket creates greater transparency for intranet-based submission as it can be adjusted to enterprise needs and user preferences. It makes the submission of print data even easier to manage and execute – ensuring better take-up among staff for the new workflow.
